**Track Plant Status**

A concept of a plant management system which helps plant owners to be able to take better care of their plants in their house or outdoor. The main focus was to make a a simple and clean user interface which allows users to organise their plants in different groups, mark when a plant or a group of plant is watered or invite friends and family to take care of the plants when the owner need's to leave town for more days.

Each plant and collection have a status displayed, to be able to track them easily. As the plant owner, you have access to a history feature, where you can easily keep an eye on the care taking activity.

**You can invite your friends, family or any person you trust to take care of your plants, while you leave town for a vacation or business trip.**

**Collections help you organize your plants in groups, and sort them based on species or needs. Every group displays a summary of its plants as well as their status.**

**Invited Moderators**
